3.1.1 2028 Summer Light High Generation

Category A Conditions

Thermal criteria violations were observed under the Category A conditions for the 2028 Summer Light (SL) High Generation (HG) Pre-Cluster and Post-Cluster study scenarios.

Notes:

[a] The facility ratings shown in Attachment A1 have been adjusted from a [72/144] kV voltage base to a [69/138] kV voltage base, as is used by the power system network analysis tool.

[b] Power flow (MVA) is current expressed as MVA (i.e., $S = \sqrt{3} \times V_{base} \times I_{actual}$)

[c] % Loading is reported as a percentage of the power flow (in MVA, i.e., $S = \sqrt{3} \times V_{base} \times I_{actual}$) relative to the transmission lines Normal Rating (also in MVA), as shown in Attachment A1.

Voltage Criteria Violations

No voltage criteria violations were observed under Category B conditions.

Category C5 Conditions

No thermal or voltage criteria violations were observed under Category C5 conditions.

[7] Most critical violations include the top 10 highest % loading of the post-cluster scenario.

3.3 High-Level Mitigation Measure - Power Flow

The AESO has developed a preliminary list of mitigation measures to address the power flow violations that were identified in the Post-Cluster scenarios, as seen in Attachment A2 Table A2-9. The detailed list of the mitigation measures will be developed by the AESO in stage 3 and will be included in the Functional Specification issued for each project.

The impacted Remedial Action Schemes (RAS) are shown in Table 3-13 below.

3.4 Constraint Effective Factor Studies

Constraint effective factor studies were conducted for all Post-Cluster scenarios. The constraint effective factors were calculated for all Category A conditions when the loadings of the monitored transmission elements in the Study Area exceeded 100% (i.e., for all of the contingencies that resulted in thermal criteria violations). The results of the constraint effective factor studies are provided in Attachment A3.

[11] The total amount of generation tied to Planned RAS 238 are expected to exceed the Most Severe Single Contingency (MSSC) limit of 466MW for each RAS. Pre-contingency generation curtailment under the Category A condition may be required using real-time operating practices to prevent generation curtailment by RAS action above the MSSC level.

4 Voltage Stability Studies

4.1 2028 SP LG Post-Cluster

Voltage stability analysis was performed for the 2028 SP LG Post-Cluster study scenario. The reference load level for the Study Area (areas 13, 28, 29, 30, 32, 34, 35, 36, 37, 38, 39, 42, and 56) is 1707.36 MW. For Category B contingencies, the minimum incremental load transfer is 5% of the reference load, or 85.37 MW (0.05 x 1707.36 MW = 85.37 MW), in order to meet the voltage stability criteria.

Table 4-1 provides the voltage stability study results under the Category A condition and for the Five worst contingencies under Category B conditions. The voltage stability diagrams are provided in Attachment A4.

Table 4-1: Voltage Stability Study Results under Category A/B Conditions for Scenario 10

Contingency (System Element Lost)	From	To	Maximum Incremental Transfer (MW)	Meets Criteria?
N-0	System Normal		1693.75	Yes

4.2 2028 WP LG Post-Cluster

Voltage stability analysis was performed for the 2028 WP LG Post-Cluster study scenario. The reference load level for the Study Area (areas 13, 28, 29, 30, 32, 34, 35, 36, 37, 38, 39, 42, and 56) is 1811.64 MW. For Category B contingencies, the minimum incremental load transfer is 5% of the reference load, or 90.58 MW (0.05 x 1811.64 MW = 90.58 MW), in order to meet the voltage stability criteria.

Table 4-2 provides the voltage stability study results under the Category A condition and for the Five worst contingencies under Category B conditions. The voltage stability diagrams are provided in Attachment A4.

5.4 High-Level Mitigation Measure – Transient Stability

Three transient instabilities were identified and can be mitigated by the following actions:

- A new transient stability RAS for 9L29 contingency is proposed which would trip P2764 with no time delay.
- A new transient stability RAS for 9L24 contingency is proposed which would P2356 RES Oyen with no time delay.
- A new instability for 953L contingency is observed. The instability can be mitigated by reducing the fault clearing time to 5-cycles or less.

The detailed list of the mitigation measures will be developed by the AESO in stage 3 and will be included in the Functional Specification issued for each project. Mitigation measures may involve modifying or adding real-time operational practices and/or remedial action schemes (RASs).

6 Short Circuit Studies

The purpose of short-circuit current level studies is to determine the expected system short-circuit current levels in the cluster region.

Low short circuit studies were performed for 2028 SL Post-Cluster scenario with one transmission element or one generator out of service (i.e., N-1). The lowest short circuit level and associated contingency were reported.

Maximum short circuit studies were performed for the 2028 WP Pre-Cluster scenario, 2028 WP Post-Cluster scenario and 2033 WP Post-Cluster scenario under system normal condition (i.e., N-0).

6.1 Pre-Cluster Results

6.1.1 2028 WP HG Pre-Cluster

Pre-Cluster maximum short-circuit current levels are provided in Table 6-1[12].

[12] Short-circuit current studies were based on modeling information provided to the AESO by third parties. The authenticity of the modeling information has not been validated. Fault levels could change as a result of system developments, new customer connections, or additional generation in the area. It is recommended that these changes be monitored and fault levels reviewed to ensure that the fault levels are within equipment operating limits. The information provided in this study should not be used as the sole source of information for electrical equipment specifications or for the design of safety-grounding systems.

7 Conclusions

Total of eighteen (18) new generation and energy storage projects were submitted to Central Cluster with a combined STS of 2282 MW and DTS of 1301 MW. Projects were clustered together and studied under high generation STS and low generation DTS scenarios. Power flow, voltage stability, transient stability and short circuit studies were performed using the AESO's preferred connection alternative presented in Table 2-1 to identify the impact of projects on the system. The detailed assessment uses credible worst-case conditions to assess the impact of the projects connecting on the Alberta Interconnected Electric System. The studies identified a number of Pre-Cluster and Post-Cluster system performance issues.

In order to integrate the projects proposed in this Cluster, up to 1398 MW of generation (existing generation and generation projects that have met the AESO project inclusion criteria) was dispatched down in the study cases to mitigate the observed thermal criteria violations under high renewable scenarios. This suggests real time generation curtailment may be required under Category A conditions to mitigate thermal criteria violations.

The thermal and voltage criteria violations observed under Category B conditions can be mitigated through the use of existing, planned and modified RASs and real-time operational practices, alone or in combination, as appropriate. The generation tied to several RASs in Central area are expected to exceed the Most Severe Single Contingency (MSSC) limit of 466 MW. Pre-contingency generation curtailment under the Category A condition may be required using real-time operational practices to prevent generation curtailment by RAS action above the MSSC level and to maintain the system reliability.

The transient stability concerns observed under Category B conditions can be mitigated through the use of new RASs and reducing the fault clearing times on specific lines.

Post-cluster maximum short-circuit fault levels were not significantly higher than pre-cluster levels. Minimum short circuit level was also provided at the point of interconnection of each project to identify the risk of reliability concerns tied to weak system conditions.

Considering the significant interest from the multiple projects in the Central Cluster, there are high chances that existing generating assets, as well as upcoming projects, may experience curtailment in real-time under both Category A and Category B conditions. In such situations, the AESO will apply Section 302.1 of the ISO Rules, *Real Time Transmission Constraint Management* to manage the safe and reliable operation of the system. Additionally, if the AESO determines that congestion will arise under Category A conditions, the AESO may make an application to the AUC to obtain approval for an "exception under Section 15(2)" of the *Transmission Regulation*.

3 Criteria, Standards and Requirements

3.1 AESO Reliability Criteria

The Transmission Planning (TPL) Standards, which are included in the Alberta Reliability Standards, and *Transmission Planning Criteria – Basis and Assumptions (see Attachment A),* (collectively, the Reliability Criteria) will be applied to evaluate system performance under Category A system conditions (i.e., all elements in-service) and following Category B contingencies (i.e., single element outage), prior to and following the studied alternatives. Below is a summary of Category A and Category B system conditions.

Category A, often referred to as the N-0 condition, represents a normal system with no contingencies and all facilities in service. Under this condition, the system must be able to supply all firm load and firm transfers to other areas. All equipment must operate within its applicable rating, voltages must be within their applicable range, and the system must be stable with no cascading outages.

Category B events, often referred to as an N-1 or N-G-1 with the most critical generator out of service, result in the loss of any single specified system element under specified fault conditions with normal clearing. These elements are a generator, a transmission circuit, a transformer, or a single pole of a DC transmission line. The acceptable impact on the system is the same as Category A. Planned or controlled interruptions of electric supply to radial customers or some local network customers, connected to or supplied by the faulted element or by the affected area, may occur in certain areas without impacting the overall reliability of the interconnected transmission systems. To prepare for the next contingency, system adjustments are permitted, including curtailments of contracted firm (non-recallable reserved) transmission service electric power transfers.

Category C5 events results in loss of two circuits of a multiple circuit tower. All equipment must operate within its applicable rating, voltages must be within their applicable range, and the system must be stable with no cascading outages. For Category C5, the controlled interruption of electric supply to customers (load shedding), the planned removal from service of certain generators, and/or the curtailment of contracted firm (non-recallable reserved) transmission service electric power transfers may be necessary to maintain the overall reliability of the interconnected transmission systems.

The TPL standards, TPL-001-AB-0, TPL-002-AB1-0, and TPL-003-AB-0, have referenced Applicable Ratings when specifying the required system performance under Category A, Category B, and selected Category C5 events. For the purpose of applying the TPL standards to the studies documented in this report, Applicable Ratings are defined as follows:

- Normal thermal rating of the line's loading limits for each season;
- The highest specified loading limits for transformers;
- For Category A conditions: Voltage range under normal operating condition per AESO Information Document #2010-007RS, *General Operating Practices – Voltage Control* (ID #2010-007RS). For the busses not listed in ID #2010-007RS, Table 2-1 in the *Transmission Planning Criteria – Basis and Assumptions* applies;
- For Category B and Category C5 conditions: The extreme voltage range values per Table 2-1 in the *Transmission Planning Criteria – Basis and Assumptions; and*

3.2 ISO Rules and Information Documents

ID #2010-007RS will be used to establish system normal (i.e., pre-contingency) voltage profiles for the Study Area.

The TCM Rule will be followed to set up the study scenarios and assess the impact of the Project. In addition, due regard will be given to the following:

- The AESO's *Connection Study Requirements*;
- *The AESO's Connection Requirements for Inverter-Based Resources (IBRs)*
- *All Applicable Sections mentioned under Division 503 - Technical and Operating Requirements*

4.2.3 Generation Assumptions

The generation forecast to be used for the studies is based on the 2023 LTO with modifications to incorporate the latest forecast intelligence. The generation assumptions for the studies will assume high generation dispatch for STS studies and low generation for DTS studies in the Central Cluster.

The existing generation (excluding wind and solar) dispatch conditions for the study scenarios are described in Table 4-4.

In Low Generation scenarios (2028 SP LG and 2028 WP LG), Sheerness #1 (SH1) will be considered offline to simulate the N-G condition in Power Flow and Voltage Stability study.

4.2.5 HVDC Power Order Assumptions

The Western Alberta Transmission Line (WATL) and the Eastern Alberta Transmission Line (EATL) are high-voltage direct current (HVDC) transmission lines. The HVDC power order assumptions for the studies will be set to minimize losses for the pre-project and post-project study scenarios.

4.2.6 Protection Fault Clearing Times

The transient stability studies will be performed for all the contingencies in the Study Area using the standard fault clearing times[6] that are specified in Table 2-3 of the AESO's *Transmission Planning Criteria – Basis and Assumptions*.

4.2.7 Voltage Profile Assumption

ID #2010-007RS will be used to establish system normal (i.e., pre-contingency) voltage profiles for key area busses prior to commencing any studies. Table 2-1 of the *Transmission Planning Criteria – Basis and Assumptions* applies for the busses not included in ID #2010-007RS. These voltages will be used to set the voltage profile for the study base cases prior to the power flow studies.

[6] Actual fault clearing time will be used in studies, if available.

For the engineering studies, all transmission facilities 69 kV and above, within the Study Area and the transmission lines connecting it to the neighboring planning areas will be studied and monitored to assess the impact of the Projects in the Central Cluster on the performance of the AIES, including any violations of the Reliability Criteria (as defined in Section 3.1).

5.1 Required Studies for All Projects in the Central Cluster

5.1.1 Power Flow Studies

Power flow studies will be performed to identify thermal and voltage criteria violations as per the Reliability Criteria. All transmission facilities 69 kV and above, within the Study Area and the transmission lines

connecting it to the neighbouring planning areas will be studied and monitored under Category A, B and C5[7] conditions.

For the Category B and selected C5 power flow studies, the transformer taps and switched shunt reactive compensating devices such as shunt capacitors and reactors will be locked, and continuous shunt devices will be enabled.

The scenarios to be studied are shown in Table 5-1.

5.1.1.1 Contingencies to be Studied

Power flow studies will be performed in the Study Area for the Category A, all Category B and selected Category C5 contingencies as provided below:

1. 953L/1047L (Double Circuit section going in Nilrem 574S)
2. 1083L/914L (Double Circuit section going to Bigstone 86S/ Wolf Creek 288S)
3. 929L/925L (Red Deer 63S to Janet 74S)
4. 914L/912L (Double Circuit section going to Red Deer 63S)
5. 933L/934L (Anderson 801S to Ware Junction 132S)
6. 679L/680L (Tucuman 478S to Nilrem 574S)

8. 9L960/9L961 (Whitefish Lake 825S to Deerland 13S)
9. 906L/928L (Benalto 17S to Sarcee 42S)

5.1.2 Transient Stability Studies

The Genesee generating unit 3 in Wabamun (Area 40) will be used as the reference for the studies.

The report presenting the results of the transient stability studies will provide response plots for several variables, including rotor angle, and active and reactive power output for the main generation units in Study Area. The report will also provide the 69 kV and above bus voltage levels for main substations as well as the key branch active and reactive power flow in the Study Area.

Transient stability studies will be performed for the post-project scenarios as shown in Table 5-1. If any transient stability issues are observed, transient stability analysis will be performed for the corresponding pre-project scenarios.

5.1.2.1 Contingencies to be Studied

Transient stability studies will be performed for all Category B contingencies in the Study Area.

[7] Selected contingencies.

5.1.3 Short Circuit Current Level/Ratio Studies

Maximum fault current levels will be provided for the main substations in the Study Area under Category A conditions. Minimum fault current levels will be calculated under N-1[8] system condition at the point of interconnection of each project.

Three-phase faults and single line-to-ground faults will be simulated and short-circuit current will be reported for the main substations in the Study Area. Winter peak scenarios will be used to calculate the maximum short circuit level. Summer light scenario under N-1 system condition will be used to calculate minimum short circuit level at the point of interconnection of each project. Polar coordinates and per-unit values will be used for reporting the short circuit level.

The scenarios to be studied are shown in Table 5-1.

5.2 Required Studies for Projects with DTS[9] Request in the Central Cluster

5.2.1 Voltage Stability Studies

The objective of voltage stability study is to determine the ability of the transmission system to maintain voltage stability margin at all busses under Category A and Category B conditions. The power-voltage (PV) curve is a representation of voltage change as a result of increased power transfer between two systems. The incremental transfers will be reported at the collapse point.

Voltage stability studies will be performed for the post-project scenarios and only for storage or pumped hydro projects which applied for DTS. Voltage stability studies for pre-cluster scenarios will only be performed if post-cluster scenarios show voltage stability criteria violations.

Voltage stability studies will be performed according to the Western Electricity Coordinating Council (WECC) Voltage Stability Assessment Methodology. WECC voltage stability criteria states, for load areas, post-transient voltage stability margin is required for the area modeled at a minimum of 105% of the reference load level for Category A conditions and for Category B conditions. For this standard, the reference load level is the maximum established planned load.

Typically, voltage stability studies are carried out assuming the worst-case scenarios in terms of loading. Voltage stability studies will be performed by increasing the load in the Central East region and increasing the generation outside the Central region.

The scenarios and cases to be studied are shown in Table 5-1.

5.2.1.1 Contingencies to be Studied

Voltage stability studies will be performed for all Category B contingencies in the Study Area. The Category A condition and the five contingencies with the smallest stability margin will be presented in the results.

[8] Critical conventional generator in the area

[9] Excluding Station Service Load

6 Mitigation Measures

High-level mitigation measures will be proposed for the post-cluster system performance issues. Mitigation measures may involve modifying or adding real-time operational practices and/or remedial action schemes (RASs).

Constraint effective factor analysis will be performed to determine the generator constraint effective factors and to identify the most effective generators to manage the thermal criteria violations, if any, that are observed under Category A and B conditions.

7 Changes to Study Assumptions

This study will utilize the AESO's planning base cases, which are based on the AESO's current corporate forecast (2023 LTO) with modifications to incorporate the latest forecast intelligence. Sensitivity studies or restudy may be required in the event of revisions to the study assumptions. Additional engineering studies may also be required to assess new connection alternatives, changes to project ISD, or delays in proposed system developments.

1. Introduction

This document presents the reliability standards, criteria, and assumptions to be used as the basis for planning the Alberta Transmission System. The criteria, standards and assumptions identified in this document supersede those previously established.

2. Transmission Reliability Standards and Criteria[1]

The AESO applies the following Alberta Reliability Standards to ensure that the transmission system is planned to meet applicable performance requirements under a defined set of system conditions and contingencies. A brief description of each of these standards is given below:

1. **TPL-001-AB-0: System Performance Under Normal Conditions**

   Category A represents a normal system condition with all elements in service (N-0). All equipment must be within its applicable rating, voltages must be within their applicable ratings and the system must be stable with no cascading outages. Under Category A, electric supply to load cannot be interrupted and generating units cannot be removed from service.

2. **TPL-002-AB1-0: System Performance Following Loss of a Single BES Element**

   Category B events result in the loss of any single element (N-1) under specified fault conditions with normal clearing. The specified elements are a generating unit, a transmission circuit, a transformer or a single pole of a direct current transmission line. The acceptable impact on the system is the same as Category A with the exception that radial customers or some local network customers, including loads or generating units, are allowed to be disconnected from the system if they are connected through the faulted element. The loss of opportunity load or opportunity interchanges is allowed. No cascading can occur.

3. **TPL-003-AB-0: System Performance Following Loss of Two or More BES Elements**

   Category C events result in the loss of two or more bulk electric system elements (sequential, N-1-1 or concurrent, N-2) under specified fault conditions and include both normal and delayed fault clearing. All of the system limits for Category A and B events apply with the exception that planned and controlled loss of firm load, firm transfers and/or generation is acceptable provided there is no cascading.

4. **TPL-004-AB-0: System Performance Following Extreme BES Events**

   Category D represents a wide variety of extreme, rare and unpredictable events, which may result in the loss of load and generation in widespread areas. The system may not be able to reach a new stable steady state, which means a blackout is a possible outcome. The AESO needs to evaluate these events, at its discretion, for risks and consequences prior to creating mitigation plans.

5. **FAC-014-AB1-2: Establishing and Communicating System Operating Limits**

   The AESO is required to establish system operating limits where a contingency is not mitigated through construction of transmission facilities

[1] A complete description of the *Alberta Reliability Standards* can be found on the AESO's website: https://www.aeso.ca/rules-standards-and-tariff/alberta-reliability-standards/

2.1 Thermal Loading Criteria

The AESO Thermal Loading Criteria require that the continuous thermal rating of any transmission element is not exceeded under normal and post-contingency operating conditions. Thermal limits are assumed to be 100% of the respective normal summer and winter ratings. Emergency limits are not considered in the planning evaluations.

2.2 Voltage Range and Voltage Stability Criteria

The normal minimum and maximum voltage limits as specified in the following table are used to identify Category A system voltage violations, while the extreme minimum and maximum limits are used to identify Category B and C system violations. Table 2-1 presents the acceptable steady state and contingency state voltage ranges for the AIES. Table 2-2 provides voltage stability criteria used to test the system performance.

2.3 Transient Stability Analysis Assumptions

Standard fault clearing times as shown in Table 2-3 are used for the new facilities or when the actual clearing times are not available for the existing facilities. Double line-to-ground faults are applied for the Category C5 events with normal clearing times. Single line-to-ground faults are applied for Category C6 to C9 events with delayed clearing times as depicted in Table 2-4 and Table 2-5.

Attachment B: Transmission Facility Ratings

The legal owners of transmission facilities (TFOs) provided the thermal ratings assumptions for the existing transmission lines in the Study Area. Table B-1 shows the normal ratings and emergency ratings for the key transmission lines in the Study Area, which will be used to perform the engineering studies.

Table B-1: Thermal Rating Assumptions for Key Transmission Lines in the Central Cluster

Note:
"CT" indicates that the transmission line is limited by current transformer.

"bus cond" indicates that the transmission line rating is limited by the bus conductor.

"GS" indicates that the transmission line rating is limited by the gang switch.

The TFOs provided the details of the substation transformers in the Study Area. The key transformers in the Study Area are shown in Table B-2.

Transient Stability Studies[1]

The Genesee #3 in Wabamun (Area 40) was used as the reference for the studies.

Transient stability studies were performed for Scehnario #4 - 2028 SL HG Post-Cluster, Scenario #5 - 2028 SP HG Post-Cluster and Scenario #6 - 2028 WP HG Post-Cluster, as described in the Stage 2 Study Scope. Results are summarized in Table 1, 2 and 3.

Studies were conducted by considering several variables, including rotor angle, bus voltages and active and reactive power output for the key generators and transmission elements in Central Cluster 1 as listed below.

Machines: (P and Q for renewables machines, P, Q and Angle for traditional machines)

P2707 – Sounding Creek Solar Battery, P2728 – Kersey Solar Battery, P2747 – Vegreville 709S DER Battery, P2753 – Jarrow 252S DER Solar Battery, P2754 – Tucuman 478S DER Solar Battery, P2758 – UK TC II MPC Solar, P2763 – Hand Hills Battery, P2764 – Hand Hills Wind & Solar, P2774 – CastorNorth Solar, P2789 – Red Willow Solar Battery, P2792 – Cascade Gas, P2804 – Nevis Solar, P2827 – Vilna 777S DER Solar, P2829 – Coronation 773S DER Solar, P2839 – Edgerton Wind, P2845 – Marguerite Lake CAE Storage, P2849 – Nose Hill MPC Wind Battery and P2852 – Wainwright 51S DER Solar Battery.

Machine angles for Sheerness #1 and Brazeau Hydro.

Buses: (Voltage)

240 kV:

Nevis 766s, Cordel 755s, Pemukan 932s, Hansman Lake 221s, Nilrem 574s and Red Deer 63s.

138 kV:

Taber 83s.

Branches: (P and Q flow)

912L (Nevis 766s – Red Deer 63S), 920L (Nevis – P2789), 901L (Red Deer 63s – Janet 74s), 900L (P2697 - Red Deer 63s) and 928L (Sarcee 42s – Benalto 17s).

[1] Transient stability study was performed based on the preliminary project generator dynamic model submitted by the market participant along with the stage 0 PDUP. It is recognized these preliminary models were not fully tuned and optimized for individual project locations and connection configurations. Some of the models demonstrated unexpected behaviors during the study which were fixed by tweaking the parameters. Although the issues will not alter the overall conclusion regarding the connection, it is expected that the market participant will work on those models and resubmit more realistic facility models at later project stages to the AESO.
