

## Process Overview

- The Connection Process is followed when the AESO determines that a System Access Service Request (SASR) will require the addition or alteration of facilities on Alberta's transmission system.
- This process follows a gated approach and is designed to move projects through seven consecutive stages. Projects must complete all required deliverables for a stage in order to advance to the next stage.
- Below is a list of some of the key deliverables, and a high-level flowchart of important activities and the parties generally involved. See [Connecting to the grid](#) on the AESO website for more detailed information.

### Who is involved in the process?

- Alberta Electric System Operator (AESO)
- Market Participant (MP)
- Transmission Facility Owner (TFO)
- Alberta Utilities Commission (AUC)
